

# BUILDING YOUR WORMERY

**1** Before getting started, please check your delivery package against the checklists below to ensure it contains all the correct items.

## Standard Tiger Wormeries (3 or 4 Tray)

- 3 or 4 x trays depending on which wormery you've chosen
- 1 x drainage sump tray (with hole)
- 1 x holding tray (looks like a normal tray, but with a hole)
- 1 x pack of lime mix (1.5kg)
- Coir worm bedding
- 1 x pouch of tiger worms or worm card voucher
- 1 x stand
- 1 x tap with white nut & 2 washers
- 1 x lid
- 4 x screws with wing nuts

## Deluxe Tiger Wormeries (3 or 4 Tray)

- 3 or 4 x Trays depending on which wormery you've chosen
- 1 x drainage sump tray (with hole)
- 1 x holding tray (looks like a normal tray, but with a hole)
- 1 x pack of lime mix (1.5kg)
- coir worm bedding
- 1 x pouch of tiger worms or worm card voucher
- 1 x stand
- 1 x tap with white nut & 2 washers
- 1 x lid
- 4 x screws with wing nuts
- 1 x pack of worm treats
- 1 x coir moisture mat
- 1 x Composting With Worms book

## Dog & Pet Poo Wormeries (3 or 4 Tray)

- 3 or 4 x trays depending on which wormery you've chosen
- 1 x drainage sump tray (with hole)
- 1 x holding tray (looks like a normal tray, but with a hole)
- Coir worm bedding
- 1 x pouch of tiger worms or worm card voucher
- 1 x stand
- 1 x tap with white nut & 2 washers
- 1 x lid
- 4 x screws with wing nuts
- 1 x pack of bokashi bran (2kg)

**2** Put the stand down with the two feet and cut outs on the ground. This is not to be confused with the standard trays which you'll need later on.

**3** Put the holding tray on the stand ensuring the holes align and secure them with the screws and wing nuts. Push each screw through a corner hole and fasten with the wing nuts.

**4** Take the sump tray and put it inside the holding tray, again ensuring that the hole in the front aligns with the hole in the holding tray, so that you can install the tap.

**5** To install the tap, put a washer on end of the tap and put the other washer inside and tighten with the white nut.

**6** Then put your first tray in and insert a single sheet of newspaper.

**7** Evenly spread the coir bedding around the first tray, just on top of the newspaper. Lightly spray it with water so that it is damp to the touch.

**8** Empty the worms into the middle of the tray, then put 2 good handfuls of food waste into a corner to start things off.

**9** Pop the lid on top and congratulations, your wormery is now ready to use! Read through the rest of this guide to learn when you should be adding the rest of your trays.

# Early days

During the assembly process, you might be worried that you're missing your sump tray. It is usually packed inside the lid as it's the same size and shape and it has a hole to distinguish it from the lid and the other components. Once your Wormery is assembled, add a small amount of food waste to a corner of your first working (bottom) tray and place the lid on top. You should wait around a week before adding further waste as the first few weeks are when the worms settle down and explore their new home and become mature.

The worms rely on the food decomposing (rotting) naturally a certain amount first, so don't worry if the food is looking rotten and mouldy – your worms will love it! For the first few weeks add a couple of handfuls of waste only every few days and increase over time thereafter. Once established, your Tiger Wormery should cope with the average food waste output of a family of 4. The Tiger Wormery is an 'upward migration' based system. Once your first tray is full, place another empty tray on top and start adding your food waste to this tray. The worms will follow the food up into the next tray through the mesh base when they're ready. Then you do the same again with your third tray and so on. By the time your third or fourth tray is full, the tray on the bottom should contain compost ready to harvest.

# What to feed your worms

YES PLEASE

NO THANKS

Your worms will eat any dead and decaying organic matter including ordinary kitchen waste such as peelings, bread, cooked and uncooked scraps, tea bags, egg shells and paper kitchen towels. In fact, virtually any organic kitchen waste can be used. As most organic kitchen waste has a high-water content, no additional water should be added.

Please note organic kitchen waste will be 85% water. With this in mind it is advisable to drain kitchen waste prior to adding it to the Wormery, especially if you use a kitchen caddy. It is surprising how much liquid can accumulate in even a small kitchen waste container. Too much water could lead to "waterlogging" of the waste, this in turn will allow the waste to compact and air will be excluded – remember that worms cannot live without air. If you include meat scraps be careful not to attract flies - either bury them or cover with a layer of coir or leaf mould.

Essentially, your Wormery is designed to deal with kitchen-generated organic food waste, however the odd handful of leaves, grass or similar garden waste may be used (avoid woody and thick fibrous material) from time to time. However, don't use large quantities of garden material such as lawn clippings as this will be far too much waste at one time and may heat up and be harmful to the worms. Large quantities of garden waste are perhaps best dealt with by conventional composting techniques involving a heap or proprietary bin such as the Rotol Compost Converter and Garden King Composter, which are both available from Original Organics ([www.originalorganics.co.uk](http://www.originalorganics.co.uk)).

You can also use waste and litter from small vegetarian pets like rabbits and hamsters, but dog and cat faeces (poo) and indeed the waste of any meat-eating animals should not be added as they can carry diseases (if you have a problem dealing with dog waste (poo) then visit [www.originalorganics.co.uk](http://www.originalorganics.co.uk) for details of our pet poo Wormery). Don't add too much onion, leek or citrus fruit peel as this tends to make the environment too acidic.

If these items are added, lime mix as provided should be added each time you add them, to help keep the compost 'sweet'. The lime mix should certainly be added if you notice tiny cotton thread-like white worms appearing. These Pot worms or enchytraeids are natural and quite harmless however, they are an indicator that the compost is becoming too acidic (the ideal pH is neutral) and/or too wet. Add one small handful every 6 weeks or so in normal conditions (crushed egg shells do the same job).

## Looking after your wormery

Conditions in each Wormery are bound to differ because of numerous variables such as type, frequency and state of food added, location of the Wormery and the temperature. No two Wormeries will have identical conditions. In view of this, operating a Wormery involves just a little bit of 'art' and some common sense.

Whilst it is true to say that the Wormery requires relatively little maintenance, its success is dependent upon the health of the worms. A short inspection on a regular basis should ensure that the worms stay on course. Every 4 weeks or so gently dig into the compost with a hand fork or stick to check that the worms are thriving, and that compost production is underway. Whilst doing this you will be able to check for any possible indications of excess moisture (waterlogging) or acidity.

Adding shredded cardboard egg cartons or several sheets of dry shredded newspaper each month will help absorb the large quantity of liquid generated and reduce any excess dampness in the compost. If in doubt add a handful of lime mix and mix in plenty of dry shredded cardboard egg cartons or newspaper. Draining off the liquid feed frequently also helps to prevent over-moist conditions. Worm composting is a simple, clean and efficient natural process. A little bit of care and attention will ensure success. Although problems are few and unusual, they are simple to avoid and usually straightforward to remedy. If conditions become less than ideal, your worms may slow down their processing of food waste.

If this occurs stop adding new food for a few weeks to give them a chance to catch up, check the Fact File and troubleshooting section in this information booklet. If you are in any doubt or have any queries concerning your Wormery please do not hesitate to call us - we are only too happy to assist. The timely resolution of any minor problem or difficulty should avoid the possibility of any more major problems or failure later.

## Harvesting your kitchen waste liquid feed

This is produced more quickly than the compost and you should be able to start tapping this off after about 3 to 4 weeks or earlier. Check for liquid every week. It is important not to allow the sump liquid level to become too high. If you think the waste material looks too wet, mix in plenty of dry shredded cardboard egg cartons or newspaper to soak up the excess.

We would advise you to check whether the Wormery sump needs emptying every week – if this is required simply pull the tap towards you to fully open it. Store the liquor in a sealed plastic container. This excellent general-purpose liquid plant food has numerous uses for house and garden plants.

Dilute the liquid with 10 parts of water to one part of liquor for your organic, liquid plant food. Typically, the liquid feed is high in the major plant nutrients potassium and phosphorus, has a medium level of nitrogen and is rich in essential minerals and trace elements. Please note that the liquid feed can have a strong odour at the point of tapping off. However, any odour should dissipate rapidly upon dilution and application.

Remember  
1 part  
worm liquid  
to  
10 parts  
water

# Emptying the compost

When your third or fourth tray is full the first tray should be ready for harvesting, this will typically be 6 months on (or longer) from when you first set up the system. The contents of the bottom tray will be a rich dark colour, if not black. Simply lift off the upper trays to access the bottom one, then remove it and harvest your compost.

The working trays are then replaced on the stand and you now have a spare tray ready to go on top of the stack when required. As most of the worms should be in the upper trays, you should not lose too many when the compost is spread on your garden. However, if a few worms are added to the garden with the compost they will not cause any harm whatsoever.

For really professional looking results, the compost can be sieved through a 12mm sieve prior to use although this is not essential. Worm compost is rich, fertile and nutritious and contains many valuable trace elements, so use in handfuls rather than barrow loads. It makes excellent top dressing or can be used to make quality potting compost. It can also be used as a topping for house plants and garden tubs and is quite excellent for tomatoes and roses. Worm casts are one of the richest natural sources of balanced organic nutrients for horticultural use known to man. Perhaps not surprisingly it's known as "the caviar of composts".

## Typical Compost Mixtures

Gardeners have their own preferences for the perfect compost mixture for a particular purpose and the ideal mix will vary according to your soil. The following formulae are typical (and for your guidance):

- Top dressing: Spread a 1" layer of worm compost as required around your plants
- Lawn dressing: 1-part sand 1-part soil 1 part worm compost
- Seed compost: 3 parts leaf mould 1-part worm compost
- Potting compost: 2 parts leaf mould 1-part worm compost 1/2-part Perlite
- Container compost: 4 parts leaf mould 2 parts worm compost 1-part sand or Perlite
- Planting compost: 1-part soil 1-part worm compost (for transplanting)

## Troubleshooting

Most of your queries will be answered in our Fact File section below, but the two most commonly encountered (but still quite rare) problems are described below:

### Excess Moisture and Waterlogging

Wormeries should always be stored under a roof or in a secluded and sheltered area for best results as they're not rainproof and could flood in the event of heavy showers, but they are perfect for a garage, shed or out-building. Signs to watch out for include any unpleasant odour in the Wormery or numerous worms that look like they're continually attempting to escape (after the first month or so of operation during which time some worm exploration is to be expected).

Both of these are generally signs of waterlogging in the compost compartment. Forgetting to tap off the liquid feed can result in the sump filling up which also stops the flow of water thus leaving the compost waterlogged and unpleasant. Your worms will not thrive under these conditions. If you are adding large quantities of water rich foods such as lettuce, cabbage and fruit peelings particularly in warmer weather, water may be rapidly released into the compost. Similarly, if the contents of the bin have become too acidic (see section on lime mix) and the worms have failed to thrive, the reduced worm activity will slow the flow of nutrient rich liquid to the sump.

It's too wet in here for me! I'm leaving!

Worm composting is a moist (damp) process, however excessive dampness (wet and soggy) will deny oxygen to the worms and severely reduce their effectiveness. The worms will leave the food waste, you will either see them at the top of the Wormery or they will have gone into the sump where they will have likely drowned because of the liquor in the sump, to remedy this situation, simply shred cardboard egg cartons or newspaper into strips and mix it well into the compost. In the unlikely event that you have a disaster and lose your worms we can of course supply replacement tiger worms at a very reasonable cost (please see our website for further details: [www.originalorganics.co.uk](http://www.originalorganics.co.uk)).

## Flies and Insects

The Tiger Wormery is designed to make access to flies and insects difficult. The fly most likely to take an interest in your Wormery is the small fruit fly (*drosophila*). A little care in operation should help reduce the likelihood of such trouble.

The risks to be aware of are:

- Adding garden soil or compost which is not sterile and may contain various insects or their eggs.
- Adding garden or kitchen waste from home grown vegetables which may have eggs or larvae on their leaves.
- Storing your kitchen waste too long or in an open container before adding to the Wormery - flies may have laid eggs on such waste and then you inadvertently introduce them to the worm bin, and finally leaving the lid off or not replacing it securely.

Flies won't do any harm, but may well be considered unpleasant or undesirable and particularly unacceptable if you keep your Wormery indoors! Should you experience a minor fly problem simply cover the surface of the food waste in the bin with a two inch layer of well-rotted compost, leaf mould, peat free compost or coir and don't add further food for 6 to 7 days - this should rapidly cure the problem. This process is called 'casing' the bin.

In the unusual event of a serious insect infestation it is likely that insects have started to breed in the Wormery. Fly paper or a sticky fly trap may well resolve this problem. Alternatively spray the bin for 8 or 9 consecutive days to break an established insect breeding cycle. We don't like recommending chemical insecticides as they're not organic, however they shouldn't harm the worms (as they will be below the surface).

# FACT FILE

## The Basics

### What is a Wormery?

A Wormery is a very simple, but highly effective and environmentally-friendly compost bin that turns dead organic matter into a superb high quality worm cast compost and a nutritious liquid feed, which you can use in your garden and around your home.

### What are the main benefits of a Wormery?

A Wormery will divert your cooked and uncooked food waste, along with things like shredded newspaper, cardboard tubes, teabags, egg boxes and more away from landfill. Not only that, a Wormery is also giving you something useful back - the highest quality compost you can get and a liquid feed which you can use to feed your plants and you can also save money with one.

### Where should I keep my worms until I'm ready to set up my Wormery?

You can store worms in the fridge once they arrive if you need some time to get your Wormery sorted. They'll also survive in the post as we put them in special bags.

# Getting Started

## I can't find my sump tray, where is it?

It will most likely be packed inside the lid as it's the same size and shape and it has a hole to distinguish it from the lid and the other components.

## Once my Wormery has been assembled, how do I get it up and running?

Once your Wormery, whether it's an all-in-one or multi-tray, is assembled, add a small amount of food waste to a corner of your first tray and place the lid on top. You should wait around a week before adding further waste as the first few weeks are when the worms settle down and explore their new home and become mature.

The worms rely on the food decomposing naturally a certain amount first, so don't worry if the food is looking rotten and mouldy. For the first few weeks add a couple of handfuls of waste only every few days and increase over time thereafter.

## What can I put in my Wormery and what should I avoid?

You CAN put the following into a Wormery:

- Most cooked/uncooked food waste.
- Small quantities of cooked meat.
- The waste and bedding from herbivorous animals like rabbits and hamsters.

AVOID putting in:

- Acidic foods including fruits and peels in quantity.
- Fish as it can get smelly quickly.
- Pet poo (except into a Pet Poo Wormery), nappies and flour.

## What is coir bedding?

The coir bedding in the plastic bag is something you can use right from the start and is a crucial component for helping worms settle into the Wormery. Simply put down a layer of newspaper and then put the coir bedding onto it, spread it evenly over the newspaper. The alternative to the coir bedding in the plastic bag is the coir block, place the block in a container, put enough water in to cover it and leave to soak. Then drain it and squeeze out excess moisture before spreading it evenly around the bottom tray on top of the newspaper. Then you can add the worms. We also sell a coir block too which works in exactly the same way. The coir bedding is not to be confused with a coir mat or coir moisture mat.

## What does a coir mat do and is it the same as a moisture mat?

A coir mat, sometimes referred to as a coir moisture mat or moisture mat, keeps your compost warm and moist and will make it easier for the worms to find the surface and it encourages them upwards to where the food waste is. The mat should be placed on the food waste in the working tray. When that tray is full and another tray is started, place the mat on the food waste in the new working tray, they will eventually rot and be eaten by the worms.

## What are the purpose of worm treats?

If your Wormery gets too wet, the worm treats can be added to absorb any excess moisture. They can be processed by your worms and are wood-based pellets. Our 1.5kg bags will give you about six months' supply and they can be added gradually.

## What is the anti-acid lime mix and what does it do?

Essentially it is a gentle form of calcium which reduces the acidity. Most food waste is mildly acidic and worms thrive best at a broadly neutral pH (7). A small handful sprinkled over the surface every 4 to 5 weeks will keep the conditions sweet. Crushed up eggshells (which are essentially calcium oxide) have the same effect.

## Why Tiger worms?

Red wigglers (Tiger worms) are recommended by most vermicomposting experts, as they have some of the best appetites and breed very quickly. Other breeds of worm can be used, but they do not adapt as well to the shallow compost bin or work as hard as the tiger worms, so the progress of your composting will be slower. Tiger worms typically live for between 6 months up to 2 years.

# The Process

## **What is the best temperature for the Wormery to operate at?**

Worms operate year round, but they work best within the temperature range we humans tend to feel comfortable in. The optimum temperature range is 18-25°C but your hard working Tiger worms will work well at lower temperatures, although there may be a noticeable 'go slow' below 10°C. Temperatures over 30°C are best avoided. Please note that in the first 8-10 weeks after setting up the Wormery, the worms are particularly vulnerable to extremes of temperature.

## **How much compost can a Wormery hold?**

Each tray in a 3 or 4 Tray Wormery can hold approximately 15.5 litres, giving 3 Tray Wormeries a capacity of roughly 46.5 litres and 4 Tray Wormeries a capacity of around 62 litres. The capacity of the all-in-one Wormeries will vary depending on which model you select and the food waste you put in it.

## **How long does the process take?**

The Wormery is quick and efficient. Within about 3 to 4 weeks you'll be tapping off the liquid feed. A handful of kitchen waste takes 6-8 weeks to turn into compost. However, most people wait until the Wormery is nearly full before emptying the compost. As you are adding food all the time it typically takes 6-12 months. Remember, over 75% of what goes in comes out as an excellent nutritious liquid plant food. Remember to dilute the liquor 10 parts water to one-part liquor before using it on your plants or vegetables.

## **What about flies?**

Flies should find it rather difficult to get into your Wormery. However, Wormeries can sometimes provide a good breeding environment for them if they are inadvertently introduced with some waste. If you do end up having a problem with flies you can use an organic fly spray to kill their lifecycle.

## **What about mould and weeds?**

In the early stages of decomposition of vegetable matter, a furry grey mould may occasionally appear. It is not unpleasant, will not affect the worms and will soon disappear. It's also unlikely weeds will appear, but possible. The most likely cause is the addition of weeds with seed heads. In any event this is no problem. Simply pick out any seedlings to prevent further growth.

## **Can I add newspaper?**

Yes, but the best thing to add to absorb excess liquid is shredded cardboard egg cartons, make sure you thoroughly mix them into the food waste. If your Wormery seems very damp then add as much dry, shredded newspaper or egg cartons as necessary to absorb the excess moisture. This may require a significant quantity of cardboard/newspaper. The occasional handful of lime mix also helps ensure that the process remains sweet.

## **Does the Wormery need to be maintained?**

A Wormery requires relatively little maintenance, but it's advisable to check on the health of the worms every few weeks to ensure it's working properly. Just gently dig into the compost with a hand fork or stick.

If you wish to clean the Wormery, use a damp cloth only and not any detergents or soaps. A wipe over with a damp cloth is all that is required to keep the unit looking good and won't harm the worms at all. If you use kitchen towel, then the towel itself can be added to the Wormery to become part of the composting process. Be sure to check and drain off the liquor produced every week.

## **Do Wormeries smell?**

A Wormery is almost an odourless process because the food is consumed by the worms rather than left to decompose. Therefore any strong odour is eliminated by the worms before it has a chance to occur. If you stick your head inside a Wormery – you may notice a compost-like sweet smell, an earthy chrysanthemum or even a tomato plant smell.

## **What is vermicomposting?**

Vermicomposting is a composting process using various species of worms, usually red wigglers (Tiger worms), white worms and other earthworms, to create vermicompost, from a mixture of decomposing vegetable or food waste and bedding materials (also called worm castings, worm humus, worm manure, or worm faeces). The end process of vermicomposting contains a nutrient-rich fertilizer and soil conditioner and also improves the moisture holding capacity of the soil.

# Worms

## **Can I put worms from the compost bin into my Wormery?**

If they are the small red wriggly worms rather than the mineral soil dwelling earthworm, the simple answer is yes. That said, there should be no need to as we provide plenty to start with and they breed well in a Wormery.

## **If I cut a worm in half, do two worms really survive?**

No. This is a myth. It is possible one half of the worm may survive (but not definite), but you definitely won't end up with two worms.

## **My worms don't seem to be moving around a lot. What does this mean?**

It's not unusual for worms to look like they're not moving around. Some people have been worried in the past that it's a sign they've died, but this is not usually the case.

The worms are kept in a refrigerated environment until shipped in the protective packing. They are semi dormant until they warm up. If you provide them some food (green vegetable leaves to start) they will soon be full of life. Our customer service team can always help with any concerns you have and are on 01462 429765.

## **Will I need to keep buying more worms for my Wormery?**

No. The great thing about worms is that they breed rapidly. If the environment in the Wormery is good for the worms they will breed well and will renew themselves so you shouldn't need to reintroduce new worms. However, should you have a disaster and need more worms we can supply them in any quantity.

## **Will I end up with too many worms in my Wormery?**

No. Worms are clever with their breeding in that they will never over populate. They regulate their reproduction based on their environmental conditions, the space they have available and the food supply.

## **Will the worms escape?**

It depends on the type of Wormery you have. From a homemade or poorly-made Wormery, escapees are likely. Our Original Wormery has been designed to keep worms in as it is a fully sealed unit, but it is possible you might have some escapees.

The main reason worms try to escape is due to the contents of the Wormery being too wet and soggy. If the waste is too wet, it becomes compacted which forces all the air out of the waste. Please note that worms also cannot survive without air which could also be a reason for them trying to escape.

You need to keep the compost in your Wormery damp to the touch, if it does become too wet, mix in some broken up cardboard egg cartons, which will help soak up any extra moisture. If you have worm treats, these work well too as they soak up moisture.

As the worms settle, they explore which is perfectly normal. Losing a few worms is nothing to be particularly worried about, as there are enough worms supplied to continue breeding.

Once the Wormery has been established and the worms have settled it provides them with their ideal environment and conditions. The worms are in an excellent and near ideal environment inside a dark, cool Wormery so they won't want to get away even if they could.

# Other Useful Information

## **Is the process safe?**

Yes. Not only is it safe, it's totally environmentally friendly, interesting and highly educational. Many youngsters delight in looking after the household Wormery and don't realise just how much they learn. Combine their interest in nature with their concern for the environment and you will get your kitchen waste bin emptied every time!

## **Do I need to dilute the liquid feed and what can I use it on?**

Yes, the feed should be diluted with 10 parts water prior to being used. The liquid feed is multi-purpose and can be used on indoor and outdoor plants, flower beds, vegetable patches or on your lawn. Please note when using the liquid feed, it needs to be diluted 10 parts water to one-part liquor, before use on your plants or vegetables.

Though it could be quicker, or longer, depending on the amount and type of food you're putting in and the time of year (or rather prevailing weather and temperature). Once the liquid starts to come through you generally tap it off every week. Please remember if you leave the liquor in the sump and worms get in they will drown.

However, don't put any of the end produce from Pet Poo Wormeries in areas where children will play or on vegetable patches.

## **Can I store the liquid feed and compost?**

Yes, the liquid can be tapped off into a suitable container (e.g. 4 and 6 pint plastic milk bottles) and stored in a cool dark location for several months prior to dilution and use. Similarly the compost can be bagged up and stored for later use.

## **What happens if I go away on holiday?**

No problem at all. A well-established Wormery should be fine left for around a month. Simply add some food waste before you go and leave the tap open with a container underneath (just to stop the build-up of liquid feed) and enjoy your holiday. The worms will look after themselves.

## **What if it all goes wrong?**

If the instructions are followed, this is unlikely. But if you do feel your Wormery is not working properly, don't panic. You can reach us on 01462 429777.
